

— PRODUCT OVERVIEW · AI AUTOMATION

We don't replace people — we take routine work off their shoulders.

Every organization has repetitive, rule-based tasks that do not require human judgment: transferring data between systems, posting invoices, compiling reports. Omnit Automation takes these tasks off your team's shoulders, allowing people to focus on work that truly creates value.

Not off-the-shelf RPA — and we don't automate everything. Every solution is built for a specific process: routine work is automated, AI handles the exceptions.

every step is traceable

An Implementation Partner, Not a Consultancy

We build systems that solve real business problems — tailored to existing operations, sustainable in the long term, for mid-sized and large enterprises. We do not pursue the most fashionable solution; we pursue the best value for money.

Three Pillars, One Partner

AI Factory

Practical AI for enterprise environments: document processing, automation, customer service, image and video analytics, prediction, intelligent search.

Data Solutions

Reliable reporting starts with well-managed data: ETL, BI, master data management, migration, Data Governance.

Custom Development

Business applications, system integrations, process digitization — from frontend to backend, cloud and hybrid.

What Makes Us Different

- **The team that assesses the project also builds it** — from the first workshop to production.
- **We build systems, not disconnected APIs** — frontend, backend, databases, integrations.
- **We start from real operations, not templates.**
- **Modular approach** — complete systems or individual components.
- **We specialize in projects where the challenge is difficult to define.**

KEY MESSAGE

We start with assessment and finish with a working system — and the same team carries the project from the first workshop to production.

Practical AI with Real Business Value — Not Hype

A generic AI subscription is not the same as AI built around a specific business problem, measured and integrated into enterprise operations. We build the latter: complete AI processing pipeline from your data, testing multiple models on the same dataset and selecting the best value-for-money solution.

Core AI Capabilities

- **Document Processing** — invoices, forms, contracts (typically 80% processing time reduction).
- **AI Automation** — replacing repetitive manual processes.
- **Customer Service & Contact Centers** — AI-assisted responses in Hungarian.
- **Image & Video Analytics** — manufacturing and visual quality control, performance measurement.
- **Predictive AI** — quality and behavioral forecasting.
- **Intelligent Search (RAG)** — enterprise knowledge search with source references.

Ready-Made AI Products

- **AI Invoice Posting** — rule-based, audit-ready coding from images and PDFs.
- **AI Conveyor Monitor** — video analytics for operational performance.
- **Intelligent Chatbot** — hallucination-free, RAG-based knowledge assistant.
- **Intelligent Search Engine (RAG)** — answers from documents, not lists.

Every product and service at a glance

AI Factory brings together AI services; Data Solutions creates order in enterprise data; Development builds custom systems. Every engagement starts with a fixed-price assessment.

READY-MADE SOLUTION

DOCMAN: Enterprise Document Management (Case
Management, QES, Company Gateway)

The machine handles the routine — AI handles the exceptions

It removes repetitive, rule-based work from people in three ways.

- 1 Takes over routine work**
Repetitive, rule-based tasks are handled by the system — allowing people to focus where their attention matters most.
- 2 AI for exceptions**
When automation reaches its limits due to unstructured input or exceptions, AI interprets the situation and escalates when needed.
- 3 Transparent and auditable**
Every automated step is traceable: what happened, when and why — never a black box.

IMPORTANT DISTINCTION

This is not off-the-shelf RPA software, nor a promise to automate everything. Every solution is built around a specific business process, tailored to your company's systems and rules. The key difference is that it goes beyond rule-based automation: where traditional RPA reaches its limits, AI interprets the situation or hands it over to a human.

Three situations where routine work consumes valuable human time

- 1 The same data is copied every day**
Valuable employee time is spent transferring data between systems — something integration can perform flawlessly.
- 2 Higher volumes require more people**
As volume grows, more people are needed — routine work does not scale efficiently.
- 3 Traditional automation stops**
Traditional RPA stops at unstructured input or decision points — requiring human intervention.

BOTTOM LINE

Time wasted on routine work and operations that require ever more people already costs money today — even though these tasks do not require human judgment.

Three perspectives, one solution — and where the impact is measurable

Most valuable where organizations handle large volumes of repetitive, rule-based work: moving data between systems, document processing, approval workflows and reporting. The decision is typically made on the operational side of the business.

COO / Operations

Routine work consumes the team's time, while growth requires more people.

Finance / Back Office

Recurring processing tasks (invoices, orders) and report generation create the greatest workload.

IT

The priority is an auditable solution built on existing systems — not another black box.

Where the results are measurable

Freed-up capacity

Routine work is handled by the system, allowing people to focus on higher-value tasks.

Scalable operations

Growing volumes no longer require proportionally more people — the process scales efficiently.

Fewer errors

Automated processing delivers more consistent and accurate data transfers and reporting.

What it does in practice — key capabilities

Data transfer between systems

Automatically transfers and synchronizes data between systems (ERP, CRM, spreadsheets, email).

Repetitive processing

Automatically processes incoming invoices, orders and requests — from recognition to recording.

Approval workflows

Automatically routes multi-step approvals, notifications and escalations — nothing gets stuck.

Report and document generation

Automatically generates and distributes recurring reports and documents — always on time.

AI-powered exception handling

Where rule-based automation reaches its limits, AI interprets or escalates.

Monitoring and traceability

Every automated step is auditable: what happened, when and why — no black box.

— THE DIFFERENCE · THREE PRINCIPLES

Three principles — tailored, intelligent, transparent

1 Built for a specific process

Not off-the-shelf RPA: every solution is built around your company's processes, systems and rules.

2 AI for exceptions

Where rule-based automation reaches its limits, AI interprets unstructured input or decision points.

3 Auditable operation

Every step is traceable and reviewable — the process remains transparent.

WHY IT MATTERS

Automation is built on three principles: solutions tailored to specific processes, AI-powered exception handling, and complete traceability — ensuring controlled, auditable operation.

Proof of expertise

Core architectural principles

Built for a specific process

Not off-the-shelf RPA: every solution is built around your company's processes, systems and rules — not a generic software package.

AI for exceptions

Where rule-based automation reaches its limits, AI interprets unstructured input or decision points.

Auditable operation

Every automated step is traceable and reviewable — the process remains transparent, never becoming a black box.

What makes AI AUTOMATION different

It doesn't replace people — it removes routine work

People focus on higher-value work, while the system handles repetitive, rule-based tasks.

RPA and AI together

Rule-based steps are automated, while AI and human oversight handle the exceptions.

Not an off-the-shelf solution

Every automation is built around your company's processes.

Transparent operation

Every automated step is traceable and auditable.

ABOUT PRICING — HONESTLY

There is no fixed price list — pricing depends on the business process, use cases and integration complexity. The real question is not the project cost, but how much routine work, errors and non-scalable operations are already costing your business today — costs a well-designed automation solution can significantly reduce.

— NEXT STEP

Which process consumes **the most capacity?**

In a 30-minute conversation, we'll identify which repetitive processes should be automated first and where the greatest return can be achieved. If AI Automation is not the right solution, we'll tell you that honestly too.

Routine off, people on

The system handles the rule-based work.

Proof: People stay focused on higher-value work.

AI for exceptions

Where RPA reaches its limits, AI interprets.

Proof: Unstructured input and decision points.

Transparent

Every step is traceable.

Proof: Auditable, never a black box.
