PRODUCT OVERVIEW · POWER AUTOMATE SERVICES

We automate the routine — and free up your people's time.

We automate your company's manual processes using Microsoft Power Platform — from assessment through implementation to ongoing support. You already have the platform — we bring the capability.

We do not sell Power Automate. We ensure your processes run automatically — within your existing Microsoft environment, using your existing licenses.

An Implementation Partner, Not a Consultancy

We build systems that solve real business problems — tailored to existing operations, sustainable in the long term, for mid-sized and large enterprises. We do not pursue the most fashionable solution; we pursue the best value for money.

Three Pillars, One Partner

AI Factory

Practical AI for enterprise environments: document processing, automation, customer service, image and video analytics, prediction, intelligent search.

Data Solutions

Reliable reporting starts with well-managed data: ETL, BI, master data management, migration, Data Governance.

Custom Development

Business applications, system integrations, process digitization — from frontend to backend, cloud and hybrid.

What Makes Us Different

- **The team that assesses the project also builds it** — from the first workshop to production.
- **We build systems, not disconnected APIs** — frontend, backend, databases, integrations.
- **We start from real operations, not templates.**
- **Modular approach** — complete systems or individual components.
- **We specialize in projects where the challenge is difficult to define.**

KEY MESSAGE

We start with assessment and finish with a working system — and the same team carries the project from the first workshop to production.

Practical AI with Real Business Value — Not Hype

A generic AI subscription is not the same as AI built around a specific business problem, measured and integrated into enterprise operations. We build the latter: complete AI processing pipeline from your data, testing multiple models on the same dataset and selecting the best value-for-money solution.

Core AI Capabilities

- **Document Processing** — invoices, forms, contracts (typically 80% processing time reduction).
- **AI Automation** — replacing repetitive manual processes.
- **Customer Service & Contact Centers** — AI-assisted responses in Hungarian.
- **Image & Video Analytics** — manufacturing and visual quality control, performance measurement.
- **Predictive AI** — quality and behavioral forecasting.
- **Intelligent Search (RAG)** — enterprise knowledge search with source references.

Ready-Made AI Products

- **AI Invoice Posting** — rule-based, audit-ready coding from images and PDFs.
- **AI Conveyor Monitor** — video analytics for operational performance.
- **Intelligent Chatbot** — hallucination-free, RAG-based knowledge assistant.
- **Intelligent Search Engine (RAG)** — answers from documents, not lists.

Every product and service at a glance

AI Factory brings together AI services; Data Solutions creates order in enterprise data; Development builds custom systems. Every engagement starts with a fixed-price assessment.

Management, QES, Company Gateway)

We automate the process — not just the task

Power Automate Services is more than workflow development. We assess your existing business processes, automate them, and make them maintainable for the long term — built on the capabilities already available in Microsoft 365.

1

Assessment

Understand how the process really works — where manual work, waiting time and repetitive tasks exist.

2

Automation

Power Automate flows, approvals and integrations — including exception handling, not just the ideal scenario.

3

Continuous improvement

Processes evolve — automation has to evolve with them. Through ongoing support and optimization.

IMPORTANT DISTINCTION

Not every process that can be automated should be automated. During the assessment, we also determine which processes deliver genuine business value and where automation would be more expensive or more fragile than the current way of working.

Three situations where manual processes cost money

1

Repetitive manual work

The same data has to be entered or copied manually every day.

2

Stalled approvals

A task gets stuck — but nobody knows where it is, why, or who is holding it up.

3

Legacy automation

SharePoint Designer-, Nintex- or VBA-based automations are still running — but nobody dares to modify them.

BOTTOM LINE

Manual work and stalled processes still cost businesses money today. We automate where it creates real business value.

Three perspectives, one solution — and three areas where the impact is measurable

It delivers the greatest value where there are many manual steps, repetitive tasks and data that must move between multiple systems. Decisions are typically made jointly by the business and IT.

Operations

Routine tasks are handled by automation — allowing your team to focus on higher-value work.

Business teams

Automatic approvals, less administration and faster case handling.

IT & Digitalization

Maintainable automations, stable integrations and solutions built to last.

Where the impact is measurable

Less manual work

Automation takes over routine tasks — allowing your team to focus on valuable work.

Faster processes

Approvals and data transfers move forward automatically and consistently.

Fewer errors

Eliminates most errors caused by manual copying and missed steps.

What we actually do — the core capabilities

Process assessment

We understand how the process really works — where time is lost and manual work occurs.

Workflow & approvals

Digital workflows, approval chains and automatic task routing.

System integration

Connecting SharePoint, Teams, Outlook, Excel, CRM, ERP and other business systems.

Exception handling

Reliable automations that continue to work when the process does not follow the ideal path.

Monitoring & support

Continuous optimization, maintenance and improvements after deployment.

Scalable automation

Documented automations that can be expanded over time — without depending on a single person's knowledge.

— THE DIFFERENTIATOR · THE THREE PRINCIPLES

Three principles — real processes, maintainable automation, measurable results

1 Real processes first

We automate the way your business actually works — not the way the software expects it to work.

2 Built to last

Exception handling, documentation and maintainability are part of every solution.

3 Business value first

We focus on the automations that deliver the fastest and most measurable return.

WHY IT MATTERS

We do not simply build flows — we build business automation that works. We first understand how your process actually operates, then automate it with exception handling, integrations and future scalability, ensuring the solution remains maintainable over the long term.

Proof of expertise

The three building blocks

Built around your business processes

We do not force predefined templates onto your business. We first understand how the process actually works, then build the automation around it.

Reliable automation

Built with exception handling, error handling, and comprehensive documentation — so your flows remain reliable over the long term.

Maintainable solutions

We build documented, extensible automations, ensuring your operations do not depend on one person's knowledge and remain sustainable in the long term.

What makes POWER AUTOMATE SERVICES different

Business-first approach

We understand how your business works before we automate it.

Designed for real-world scenarios

Built not only for the ideal case, but also for exceptions and unexpected situations.

Works within your Microsoft environment

Seamlessly integrated with SharePoint, Teams, Outlook, Excel, CRM and ERP.

Built to evolve

Documented, extensible automations that are easy to modify and expand over time.

ABOUT PRICING — HONESTLY

There is no fixed price list. Pricing is project-based, depending on the number and complexity of the processes, as well as the required integrations. The real question is not the project price, but the cost of daily manual work, stalled approvals and repetitive administration — all of which a well-designed automation can eliminate.

— NEXT STEP

Which process **should you automate first?**

In a 30-minute consultation, we review your current operations and identify the process that offers the greatest potential business savings through automation. If Power Automate is not the right solution, we will tell you that honestly.

Automatable

A large proportion of repetitive manual tasks can be eliminated.

Proof: Less repetitive administration.

Integrated

Built on your existing Microsoft environment.

Proof: SharePoint, Teams, Outlook, Excel, CRM and ERP.

Sustainable

Documented, maintainable automations.

Proof: Does not depend on the knowledge of a single individual.
