

— PRODUCT OVERVIEW • DATA ASSESSMENT

Where does your data stand — and what should you fix first?

Many companies feel that something is wrong with their data, but lack a structured view of the situation. Omnit's Data Assessment is a focused 2-3 week engagement that shows where your data stands today, identifies the 3-5 key pain points, and defines the order in which they should be addressed.

This is not a full data audit and not a strategy project. It is a clear executive-level assessment. Delivered by an implementation team with 15+ years of experience, 1000+ TB of managed data, and 200+ projects completed, it is practical, actionable, and low-risk. Fixed-price engagement from €1,450.

An Implementation Partner, Not a Consultancy

We build systems that solve real business problems — tailored to existing operations, sustainable in the long term, for mid-sized and large enterprises. We do not pursue the most fashionable solution; we pursue the best value for money.

Three Pillars, One Partner

AI Factory

Practical AI for enterprise environments: document processing, automation, customer service, image and video analytics, prediction, intelligent search.

Data Solutions

Reliable reporting starts with well-managed data: ETL, BI, master data management, migration, Data Governance.

Custom Development

Business applications, system integrations, process digitization — from frontend to backend, cloud and hybrid.

What Makes Us Different

- **The team that assesses the project also builds it** — from the first workshop to production.
- **We build systems, not disconnected APIs** — frontend, backend, databases, integrations.
- **We start from real operations, not templates.**
- **Modular approach** — complete systems or individual components.
- **We specialize in projects where the challenge is difficult to define.**

KEY MESSAGE

We start with assessment and finish with a working system — and the same team carries the project from the first workshop to production.

Practical AI with Real Business Value — Not Hype

A generic AI subscription is not the same as AI built around a specific business problem, measured and integrated into enterprise operations. We build the latter: complete AI processing pipeline from your data, testing multiple models on the same dataset and selecting the best value-for-money solution.

Core AI Capabilities

- **Document Processing** — invoices, forms, contracts (typically 80% processing time reduction).
- **AI Automation** — replacing repetitive manual processes.
- **Customer Service & Contact Centers** — AI-assisted responses in Hungarian.
- **Image & Video Analytics** — manufacturing and visual quality control, performance measurement.
- **Predictive AI** — quality and behavioral forecasting.
- **Intelligent Search (RAG)** — enterprise knowledge search with source references.

Ready-Made AI Products

- **AI Invoice Posting** — rule-based, audit-ready coding from images and PDFs.
- **AI Conveyor Monitor** — video analytics for operational performance.
- **Intelligent Chatbot** — hallucination-free, RAG-based knowledge assistant.
- **Intelligent Search Engine (RAG)** — answers from documents, not lists.

Every product and service at a glance

AI Factory brings together AI services; Data Solutions creates order in enterprise data; Development builds custom systems. Every engagement starts with a fixed-price assessment.

READY-MADE SOLUTION

DOCMAN: Enterprise Document Management (Case
Management, QES, Company Gateway)

A clear executive view — not a full audit, not a strategy project

A focused 2–3 week assessment that identifies where things stand, the 3–5 key pain points, and the order in which they should be addressed.

1 Current State

Review of systems, reports, and data challenges — where data originates, where it is stored, and where the gaps are.

2 3–5 Key Pain Points

Not a long and intimidating list — only the most important issues analyzed in meaningful depth.

3 Prioritization

Ranked by business impact, implementation difficulty, and dependencies — with a concrete first step.

IMPORTANT DISTINCTION

The Data Assessment is not a full data audit and not a strategy engagement. It is a focused executive-level assessment delivered in 2–3 weeks. Rather than theory, it provides a practical view of the company's real data situation. As we often say: AI readiness is actually data readiness. The assessment also helps determine whether a full audit is necessary at all.

— THE PROBLEM THE DATA ASSESSMENT SOLVES

Three situations that signal data problems

1

Two systems, two numbers

Reports do not match. Different systems provide different answers to the same question. Reporting issues often originate from master data problems.

2

Decisions based on assumptions

Management does not trust the data, so decisions are made based on assumptions rather than facts.

3

No one knows where to start

Master data chaos, fragmented information, and manual Excel reporting create uncertainty about the right first step.

THE BOTTOM LINE

AI only makes bad data move faster. A failed data project or a migration blocked by poor data quality costs far more than a 2–3 week assessment.

Three perspectives, one entry point — and where value is created

The decision is made where poor data causes daily pain or major change: executive leadership, finance, and IT. The business side decides; IT implements. The Data Assessment is the entry-level product of Data Solutions — the counterpart of the AI Opportunity Check and Solution Blueprint.

CEO / Managing Director

They know something is wrong with the data but lack a structured view before making major decisions.

Finance / Controlling

Their pain point is unreliable reporting and decisions based on assumptions.

IT (Implementation)

Clear priorities and a realistic first step are essential — the business defines priorities, IT delivers the solution.

How to measure success

Avoided failed data projects

A misdirected data project or failed migration can cost many times more than a 2–3 week assessment.

Clear priorities

Leadership receives not just a list of problems, but a ranked roadmap and a realistic first step.

A stronger foundation for AI

AI readiness starts with data readiness. The assessment shows what needs to be fixed first.

What happens during the engagement

Data landscape review

Assessment of systems, reports, and data issues — where data originates, where it is stored, and where the gaps are.

Preparation questionnaire

A structured questionnaire (approximately 30 minutes): systems (ERP, CRM, custom applications, Excel), reporting, pain points, and previous projects.

Focused workshops

2–3 workshops, up to 2 hours each, with up to three participants. Review of the current state, key pain points, and prioritization of the 3–5 most important issues.

Written assessment

8–12 pages covering current state, key pain points, and prioritization in executive language.

Prioritization

Pain points ranked by business impact, complexity, and dependencies — resulting in a realistic first step.

Quick wins (optional)

If a problem can be solved quickly with limited effort and immediate business value, we highlight it separately.

— WHAT MAKES IT DIFFERENT

The document: 8–12 pages, executive language, four sections

1

Current State (2–3 pages)

Overview of the company's data landscape: systems, reports, and where data is created and stored.

2

The 3–5 Main Pain Points (3–5 pages)

The most important issues explored in meaningful depth — including business impact, not just listed.

3

Prioritization (2–3 pages)

Ranking of pain points based on business impact, complexity, and dependencies — plus a realistic first step.

4

Quick Wins (0–2 pages)

Problems that can be solved quickly with minimal effort — optional, but often valuable for building momentum.

WHY IT MATTERS

The Data Assessment is an 8–12 page executive document. The real value lies in prioritization: not a long list of issues, but the 3–5 most important pain points ranked by business impact, complexity, and dependencies.

Proof of expertise

The most expensive data mistakes do not start with technology

Lack of visibility is the most expensive problem

Data projects rarely fail because of technology. They fail because teams focus on the wrong problem.

AI cannot turn bad data into good decisions

Everyone talks about AI, but AI only accelerates the consequences of poor data. First, you need to understand where your organization stands.

Migrations fail because of data quality

Many organizations discover data quality problems halfway through a migration. The assessment identifies them before the project starts.

2–3 weeks vs. six months

A short assessment can prevent a six-month project from heading in the wrong direction.

What makes Omnit different

Prioritization, not just a list

We rank issues by business impact, complexity, and dependencies — and define the first step.

If something is not worth doing, we say so

If the current situation does not justify a project, we state it clearly.

Implementation-focused, not theoretical

The assessment answers what the real situation is and what the realistic next step should be.

15+ years, 1000+ TB, 200+ projects

We are not new to data challenges. We quickly recognize what is real and what is noise.

ABOUT PRICING — HONESTLY

The Data Assessment is a fixed-price entry product starting from €1,450 + VAT. Pricing depends on the complexity of the data landscape and the number of systems involved, but is fixed before the engagement begins. The real question is not “How much does an assessment cost?” but “How much does a failed data project or a migration blocked by poor data quality cost?” In many cases, solving the 3–5 key pain points is enough — at a fraction of the cost of a full audit.

— NEXT STEP

Do you feel something is **wrong with your data?**

In a 30-minute conversation, we review your current data situation and show how the Data Assessment provides a clear executive view and a prioritized roadmap. Low-risk, fixed-price entry point — and if the timing is not right, we will tell you honestly.

Focused

Focused on the top 3–5 issues, not everything at once.

Proof: prioritized findings, meaningful depth.

2–3 weeks, fixed price

Low-risk entry point from €1,450.

Proof: questionnaire + workshops + document.

Actionable

Backed by an implementation team, not just consultants.

Proof: 15+ years, 1000+ TB, 200+ projects.
