PRODUCT OVERVIEW · BUSINESS INTELLIGENCE & REPORTING (BI)

Reports **you can trust.**

Most companies face one of two reporting problems: either they have no reports and rely on intuition and fragmented data, or they have too many reports that contradict each other. Omnit Business Intelligence delivers dashboards and reports built on a single, reliable source of truth.

Decision-support tools you can trust — and use to make decisions. A good report does not show what looks impressive; it shows what matters, from a single reliable source.

An Implementation Partner, Not a Consultancy

We build systems that solve real business problems — tailored to existing operations, sustainable in the long term, for mid-sized and large enterprises. We do not pursue the most fashionable solution; we pursue the best value for money.

Three Pillars, One Partner

AI Factory

Practical AI for enterprise environments: document processing, automation, customer service, image and video analytics, prediction, intelligent search.

Data Solutions

Reliable reporting starts with well-managed data: ETL, BI, master data management, migration, Data Governance.

Custom Development

Business applications, system integrations, process digitization — from frontend to backend, cloud and hybrid.

What Makes Us Different

- **The team that assesses the project also builds it** — from the first workshop to production.
- **We build systems, not disconnected APIs** — frontend, backend, databases, integrations.
- **We start from real operations, not templates.**
- **Modular approach** — complete systems or individual components.
- **We specialize in projects where the challenge is difficult to define.**

KEY MESSAGE

We start with assessment and finish with a working system — and the same team carries the project from the first workshop to production.

Practical AI with Real Business Value — Not Hype

A generic AI subscription is not the same as AI built around a specific business problem, measured and integrated into enterprise operations. We build the latter: complete AI processing pipeline from your data, testing multiple models on the same dataset and selecting the best value-for-money solution.

Core AI Capabilities

- **Document Processing** — invoices, forms, contracts (typically 80% processing time reduction).
- **AI Automation** — replacing repetitive manual processes.
- **Customer Service & Contact Centers** — AI-assisted responses in Hungarian.
- **Image & Video Analytics** — manufacturing and visual quality control, performance measurement.
- **Predictive AI** — quality and behavioral forecasting.
- **Intelligent Search (RAG)** — enterprise knowledge search with source references.

Ready-Made AI Products

- **AI Invoice Posting** — rule-based, audit-ready coding from images and PDFs.
- **AI Conveyor Monitor** — video analytics for operational performance.
- **Intelligent Chatbot** — hallucination-free, RAG-based knowledge assistant.
- **Intelligent Search Engine (RAG)** — answers from documents, not lists.

Every product and service at a glance

AI Factory brings together AI services; Data Solutions creates order in enterprise data; Development builds custom systems. Every engagement starts with a fixed-price assessment.

Decision-support dashboards from a single reliable source

We build dashboards and reports on a unified, reliable data foundation that support executive visibility, operational management, and decision-making at the same time.

- 1 Trusted dashboards**
Clear, up-to-date visibility of key metrics — management sees the situation at a glance.
- 2 Automated reporting**
Reports refresh automatically on schedule — no manual compilation every month.
- 3 Single source of truth**
One trusted data source — no more “which number is correct?” debates.

IMPORTANT DISTINCTION

Business Intelligence & Reporting (BI) is not another reporting maze. It creates decision-support dashboards and reports from unified, reliable data and a single trusted source. A good report does not show what looks impressive; it shows what matters — and what people can trust.

Three situations where reporting fails to support decisions

- 1 No reports — decisions by intuition**
Management decides based on delayed and fragmented information due to a lack of reliable visibility.
- 2 Too many conflicting reports**
Multiple reports provide different numbers for the same question — nobody knows which one is correct.
- 3 Manual report creation**
Monthly manual report preparation is slow, error-prone, and consumes valuable analytical capacity.

BOTTOM LINE

Decisions based on intuition, manual reporting, and endless debates about which number is correct waste valuable time, slow down execution, and ultimately cost the business money.

Three perspectives, one solution — and where the impact is measurable

Most valuable where reliable reporting is missing, or where too many conflicting reports exist. Decisions are typically made by executive management, finance, and operations — which is why these areas experience the benefits first.

Executive management

A reliable executive dashboard becomes the foundation of strategic decisions.

Finance / controlling

Consistent reporting and a single source of truth are the key benefits.

Operations

Operational reports provide day-to-day visibility and control.

Where change becomes visible

Better decisions

Management makes decisions based on facts rather than intuition.

Capacity released

Automated reporting replaces manual report preparation — time can be spent on analysis instead.

End of number debates

Every report is built from the same trusted source — no more disputes over which number is right.

What it does in practice — core capabilities

Executive dashboards

Clear, up-to-date visibility of key metrics — understand company performance at a glance.

Operational reporting

Detailed, department-specific reports for sales, finance, manufacturing, logistics, and more.

Automated report delivery

Reports refresh and arrive automatically — no manual preparation every month.

Self-service analytics

Users can drill down and analyze data themselves without involving IT for every question.

Alerts & anomaly detection

If a key metric deviates from expected levels, the system automatically alerts users.

Unified data foundation

Every report works from the same trusted source — ending conflicting numbers.

— THE DIFFERENTIATOR · THE THREE BUILDING BLOCKS

Three layers — from trusted data to alerts

1

Unified data foundation

Reports are built on a single, reliable data layer — no contradictions.

2

Automated refresh

Dashboards and reports update automatically on schedule — no manual work.

3

Self-service + alerts

Users can explore data themselves, while the system automatically alerts them when an important metric deviates from expectations.

WHY IT MATTERS

Reports run from a single trusted data source, refresh automatically, and provide self-service analytical capabilities for rapid follow-up. If a key metric deviates from expected performance, the system immediately alerts the relevant users.

Proof of expertise

The three building blocks

Single source of truth

Every dashboard and report is built from the same trusted data source — no more debates about which number is correct.

Always up to date

Reports refresh on schedule without manual intervention, ensuring decisions are based on current information rather than outdated data.

Self-service analytics

Users can analyze data themselves, while the system proactively highlights unusual changes in important metrics.

What makes BUSINESS INTELLIGENCE & REPORTING (BI) different

Single source of truth

One trusted data source — no more conflicting numbers.

Automated

Reports refresh automatically on schedule — no manual compilation.

Decision-support, not decoration

Shows what matters — and what people can trust.

Reliable data foundation

Good reporting starts with good data.

ABOUT PRICING — HONESTLY

There is no fixed price list. Pricing depends on reporting requirements, data sources, and integrations. The real question is not the project cost, but how much poor decisions, manual reporting, and constant debates over numbers are already costing the business.

— THE NEXT STEP

Debating the numbers — or deciding based on facts?

In a 30-minute discussion, we review your reporting requirements and show how a unified, reliable decision-support layer can be built. If the solution is not the right fit, we will tell you honestly.

Reliable

One trusted source of data.

Proof: no more number debates.

Automated

Reports refresh automatically on schedule.

Proof: no manual compilation.

Decision-ready

Shows what matters for decision-making.

Proof: not what merely looks impressive.
